**SUPERFUND SITE STRATEGY RECOMMENDATION**  
**GNB Incorporated**

**DISCUSSION:** The GNB Incorporated site occupies 43 acres. The facility has been manufacturing automotive batteries since 1971. Two buildings are on the site a waste water neutralization plant and the battery manufacturing building. Seventeen SWMUs have been identified at the site and include: settling ponds, neutralization pits/tanks, dumpsters, baghouses, waste water pipe, and a truck wash sump. Groundwater monitoring on the perimeter of the settling ponds indicates that a release of high level sulfates and low level lead has occurred.

HRS pathway analysis indicates the following. Groundwater is not used for drinking purposes within 4 miles of the site; therefore, groundwater migration does not pose a threat to human health or the environment. There are no residents within the immediate area and the waste of concern are not volatile. Therefore, a threat by air migration is not likely; and furthermore, the air and soil exposure pathways lack targets available to exposure. Migration by the surface water pathway is possible, but the distance the substances must migrate is beyond 1.5 miles before entering a perennial stream, and the waste quantity is not sufficient to carry significant levels that distance.

Lack of targets, migration potential, and the distance the contamination must migrate makes endangerment to human health and the environment unlikely; therefore, the GNB Incorporated site is designated No Further Remedial Action Planned (NFRAP) and at this time does not warrant further investigation under CERCLA.
